

Geemit launches portal [www.Geemit.com](http://www.Geemit.com) for trading components for the entire energy sector.

Geemit is a platform where actors in the energy and industrial sector will be able to optimize the use of existing equipment with economic, temporal winnings and environmental benefits for all.

With the portal, Geemit also aims to achieve a change of attitude to the production and procurement of items in an industry where, in the past, both money, time and resources have been wasted on equipment that can stand idle, although the market could utilize it.

"In a time when technology makes it possible to share resources, it is to connect the industry around the world and together achieve a better result", says Søren Hvorslev, CEO in Geemit.

Furthermore, he explains that the idea is to consider both the economy and the environment:

"Geemit has two purposes. We ensure tangible savings for buyers and create revenue for the sellers, while we achieve a very specific

environmental benefit of using existing equipment rather than exclusively order and produce new equipment every time."

Geemit's support team is ready by the phones to help customers around the clock. Geemit's engineers can help solving questions and clarifications about the products on the trading portal.

In addition, it is also possible for the portal's own skilled field teams on site to evaluate the log and ensure the storage of items for sale.

Thus, there is a basis for using the portal for trading with components in the project planning as for emergency requirements, making usable components visible to all and ensuring that these hidden values are exploited as cost-effective contribution to the project planning, as well as the database of available components in case of emergency needs.
